

Runtime v0

SUMMARY

Runtime is my personal cloud environment for running Claude Code. Instead of leaving my laptop running, Runtime executes Claude Code inside a persistent cloud workspace that I control from the browser. The browser is only the control plane. All execution happens inside Modal.

PROJECTS

Runtime v0 | Personal-first, browser-only, one-user cloud runtime for Claude Code with persistent repository-centric workspaces.

- Sign in with GitHub and automatically sync every repository accessible to the user.
- Connect Linear and attach issues to existing Projects without creating standalone projects.
- Create persistent Modal workspaces that clone repositories, create git worktrees, inject secrets, install dependencies, run health checks, and become Claude-ready.
- Run Claude Code remotely, stream terminal logs, review changed files/diffs, and create pull requests from the browser.
- Architecture: Browser → Railway (Next.js orchestration) → Supabase → Runtime Provider abstraction → Modal → Claude Code → GitHub.
- Defined RuntimeProvider abstraction methods: createWorkspace, resumeWorkspace, executeJob, streamLogs, suspendWorkspace, destroyWorkspace, createPullRequest.
- Implemented minimal API surface: POST /projects/sync, GET /projects, GET /projects/:id, POST /workspaces, GET /workspaces/:id, POST /jobs, GET /logs/:workspace, POST /pull-request.
- Used a minimal database model with three tables: projects, workspaces, jobs.

TECHNICAL SKILLS

Next.js

TailwindCSS

shadcn/ui

Supabase

Supabase PostgreSQL

GitHub OAuth

Linear OAuth

Modal

Claude Code CLI

Git

Node

pnpm

npm

Python

uv

Rust

Go

GitHub CLI

ripgrep

fd

jq

tmux

DESIGN PRINCIPLES

Personal-first; Browser only; One user; One GitHub account; Persistent workspaces; Repository-centric; Keep infrastructure minimal; Everything should feel like GitHub

GOALS

Build the smallest useful version that lets me: Sign in with GitHub; See every repository I have access to; Connect Linear; Create persistent workspaces; Run Claude Code remotely; Watch terminal output; Review changes; Create Pull Requests

NON GOALS

Do not build: Organizations; Teams; Multi-user support; Billing; Mobile; Voice; Notifications; Scheduling; Multi-agent orchestration; Kubernetes; Analytics; Plugin marketplace; AI chat history; Custom workflows

EXECUTION LIFECYCLE

Workspace Created → Running → Idle → Resume → Run Job → Idle → Destroy

SUCCESS CRITERIA

Remote development should feel effortless, with browser-based control and no manual SSH, cloning, dependency installation, or environment-variable setup.
